

Auto blending in EFIT-V 5.006

PROBLEM DESCRIPTION

Blending hairstyles and beards with the face so that they look natural can be achieved using the **Blend Final Image** function inside the **Finish** tool. This tool can also be used to remove pixelated edges from the image.

BEFORE

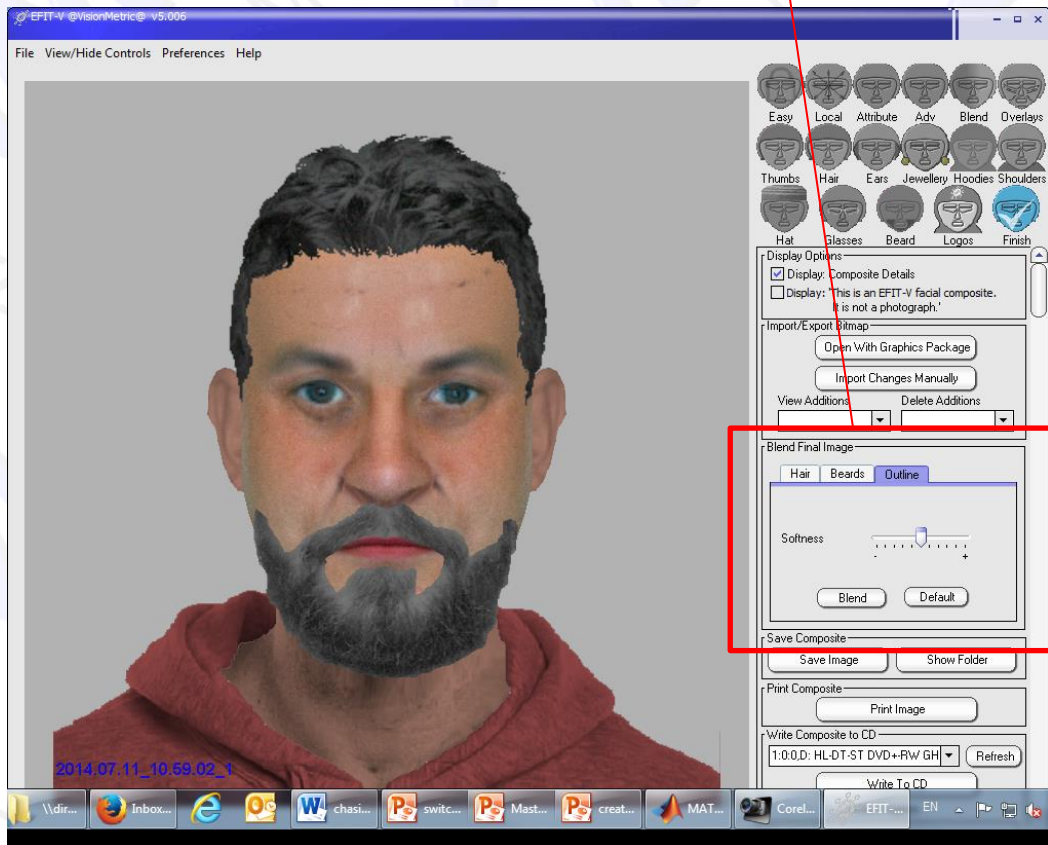

AFTER

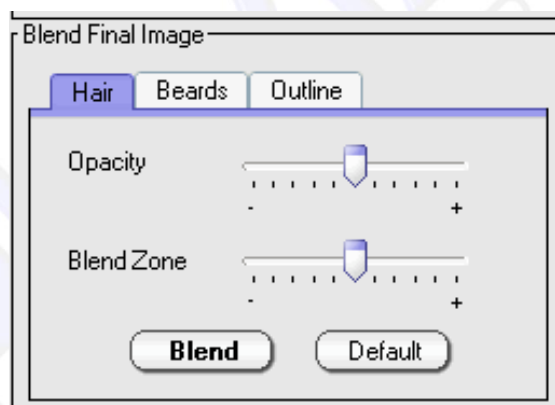

Auto blending in EFIT-V 5.006

Navigate to Blend Final Image within the Finish tool

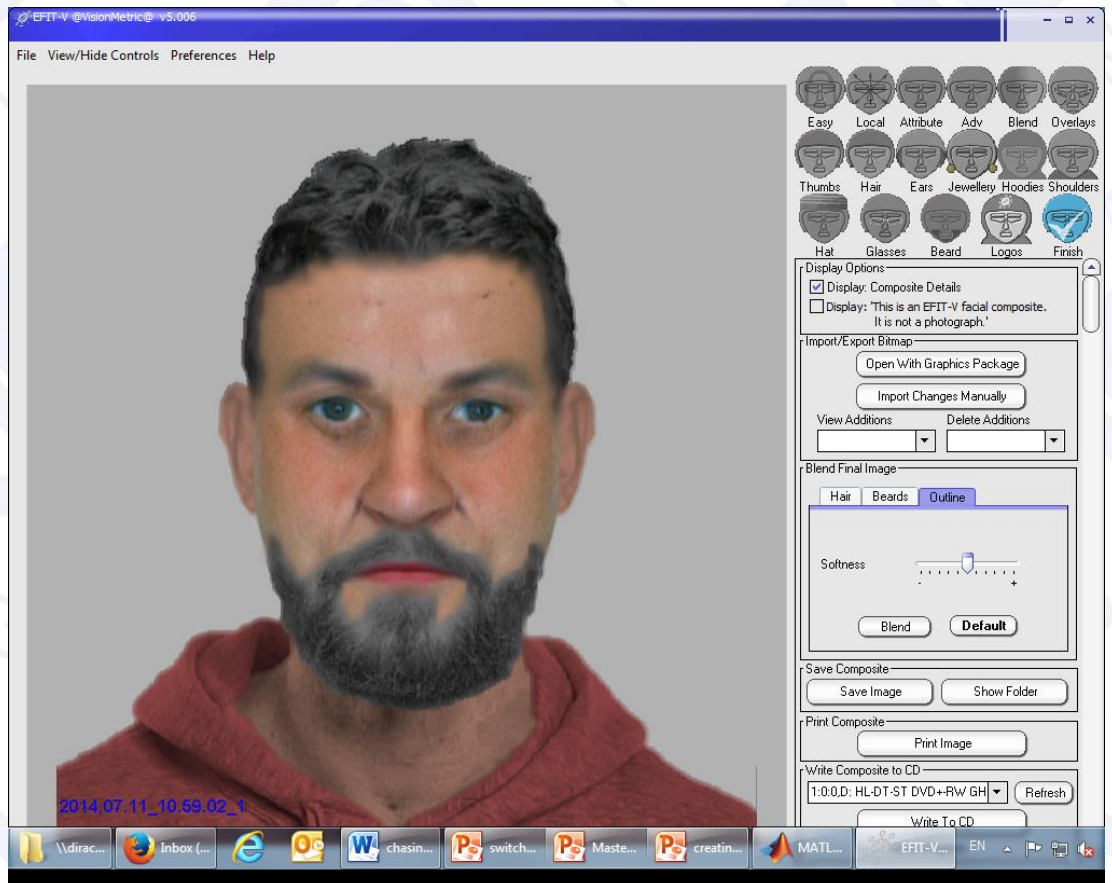

Select the tab for each of the three objects (the hair, the beard/ and the outline of the image) and then **click directly on the Blend** button to blend the selected object.

The default settings will generally produce a satisfactory result. However, you can set the strength of the blending (opacity) and the extent of the region over which the blending occurs (Blend Zone) using the sliders.

Auto blending in EFIT-V 5.006

You should use the auto-blending tool as a final step – i.e. as a means to finish and tidy prior to saving the image. If you use it and then navigate to other EFIT-V tools, the blending effect is automatically released.

Apply final blending prior to saving the completed image
